

Teisen Hoofcare Liquid

A real step forward in Hoofcare

A combination of chelate technology and special binding agents are at the heart of the Teisen Hoofcare range. The unique stabilised forms of copper and zinc found in Hoofcare Liquid and Hoofcare Gel are able to provide long term resistance to organic contamination. Good adhesion to the hoof is achieved by the inclusion of binding agents, this allows the chelated copper and zinc to remain in place and active for longer. Promoting natural healing and repair of the hoof.

Footbath or Spray ?

Teisen Hoofcare Liquid can be used in footbaths as a 1% to 2% solution. Ensure hooves are as clean as possible before foot bathing.

When spraying, wash hooves prior to application. Mix a 20% solution (up to 50% in very severe conditions).

Use Hoofcare Gel and Hoof tape on sheep with excessive horn erosion.
